

Configuring Ports on a Fiber Optic Router

Article Overview

To connect a router to a fiber optic internet connection, use the WAN port to link the router to the ONT and configure the connection type (PPPoE, DHCP, or static IP) according to your ISP.

Connecting the Router to Fiber Optic Modem

- **Identify the Optical Network Terminal (ONT):** The ONT converts the fiber optic signal into Ethernet for your router. It is usually installed by your ISP at the fiber wall outlet .
- **Use the WAN Port:** Connect an Ethernet cable from the ONT's LAN port to the WAN port on your router. This port is specifically designed to receive the internet signal from the modem .
- **Power On Devices:** Turn on the ONT first, wait for the status lights to stabilize, then power on your router .

Router Configuration

- **Access Router Interface:** Open a web browser and enter the router's IP address (commonly 192.168.1.1 or 192.168.0.1). Log in using the default credentials or those you set previously .
- **Select WAN/Internet Settings:** Navigate to the WAN or Internet section. Here, you will specify the connection type:
 - **PPPoE:** Requires a username and password provided by your ISP. Common in fiber setups where authentication is needed .
 - **DHCP:** Automatically obtains an IP address from the ISP. Often used if no credentials are required .
