

Core Node Switch

Overview

It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. Generally, these are used for two-tier or three-tier hierarchy networks. In these switches, the data routed and switched. A core switch is a high-capacity, high-performance Layer 3 switch positioned at the physical backbone of an enterprise network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. Its primary function is to rapidly forward data packets between different aggregation switches and, ultimately, to the internet. It usually has powerful processing capabilities, high.
