

Installation of the concealed door of the entrance electrical distribution box

Article Overview

A concealed electrical distribution box is installed by embedding it in a wall, securing it firmly, connecting circuits safely, and finishing the wall for a flush, hidden appearance.

Step 1: Choose the Location

Select a dry, accessible area that is away from water, flammable materials, and corrosive substances. The box should be near the main power supply for easy connection and maintenance, with enough space around it for ventilation and future upgrades. For residential installations, a height of approximately 1.5 meters above the floor is recommended .

Step 2: Prepare the Wall

- Reserve a hole in the wall 20mm larger than the box dimensions to allow for plastering and adjustments .
- The depth should equal the thickness of the box plus the plaster layer.
- Ensure the wall is structurally sound to support the box.

Step 3: Fix the Box

- Embed the box in the wall and secure it with concrete or masonry filler to prevent movement .
- Ensure the box is level and plumb, with vertical deviation not exceeding 3mm.
