

Leased Line Access Switch Settings

Article Overview

To configure a leased line on an access switch, you need to set up the physical interface, apply the correct encapsulation and authentication, assign IP addresses, and verify connectivity.

Step 1: Prepare the Access Switch

Before configuring the leased line, ensure the switch is operational:

- Power on the switch and verify indicator lights.
- Connect to the switch console using a rollover cable and terminal software like PuTTY at 9600 baud rate.
- Set a hostname and management IP address on the switch for administrative access.
- Confirm VLAN and trunking configurations if the leased line will traverse multiple VLANs .

Step 2: Identify the Leased Line Type

Leased lines can be E1, T1, or ISDN PRI, depending on your network requirements:

- E1 leased line: Typically uses PPP encapsulation and CHAP authentication.
- ISDN PRI leased line: Suitable for high-speed, long-term data exchange between branches and headquarters .
- Determine the termination type and ensure the correct equipment is available at both ends
