

Multimode transmission distance of fiber optic patch cords

Overview

Multi-mode fiber optic patch cords utilize a larger core size, typically around 50-100 microns, allowing them to carry multiple modes of light. This design enables the transmission of data over relatively short distances with high bandwidth capabilities.

What Is Multimode Fiber?

Multimode Fiber (MMF). The core difference lies in the diameter of the fiber core, which dictates how light travels and the effective transmission distance. Allows multiple paths (modes) of light. Long-distance transmission (up to kilometers). General Rules for Selecting Multimode Fiber Patch Cords Unlike single-mode modules (whose transmission is mainly limited by fiber. Single mode fiber patch cords are designed for kilometer-level transmission, while multimode fiber patch cords are optimized for short-range links, typically within data centers. This larger core allows easier light injection and lower-cost optical sources (LEDs and VCSELs), making multimode fiber the cost-effective choice for.
