

Network Optical Module Parameters

Article Overview

Optical module parameters define compatibility, performance, and reliability, ensuring efficient data transmission in fiber optic networks.

Key Parameters of Optical Modules

1. Physical and Mechanical Specifications

- **Form Factor:** Determines the module's size and compatibility with network equipment. Common types include SFP, SFP+, SFP28, QSFP, QSFP28, and OSFP .
- **Connector Type:** Interfaces with fiber cables, such as LC Duplex, SC Duplex, or MPO/MTP, and must match the patch cables used .
- **Hot-Pluggable Design:** Allows modules to be inserted or removed without powering down the system, enhancing flexibility .

2. Performance Specifications

- **Transmission Rate:** Maximum data speed supported, ranging from 100 Mbps to 800 Gbps depending on the module type .
- **Wavelength:** Determines fiber type and distance; typical values are 850 nm (multimode), 1310 nm, and 1550 nm (single-mode), .

- **Numerical Aperture (NA):** Affects coupling efficiency and signal loss; typical NA values range from 0.2 to 0.4 .

- **Modulation Scheme:** Defines how data is encoded onto light. Low-speed modules often use NRZ, while high-speed modules may use PAM4 or DP-QPSK for coherent systems .

3. Optical Power Parameters

- **Transmitted Optical Power:** Average power output by the transmitter, measured in mW or dBm .
