

Special connectors for cable trays

Article Overview

Cable tray connectors are specialized fittings used to join, splice, or adapt cable tray sections, ensuring secure, flexible, and organized cable management in industrial and commercial installations.

Types of Cable Tray Connectors

1. Splice Plates / Couplers: Used to join two sections of cable trays end-to-end. They provide structural integrity and can be reinforced for heavy loads. Examples include wire mesh coupler kits for 4-6 mm diameter basket trays, which use bolts and clamps for secure attachment (Amazon, NAYDMHN) and standard splice connectors from Superior Tray Systems that clamp vertical and horizontal wires together . 2. Elbows, Tees, and Crosses: These connectors allow directional changes in cable routing. Elbows and bends change the path by 45° or 90°, tees join three trays in the same plane, and crosses connect four trays at right angles. They are essential for navigating corners, intersections, or complex layouts . 3. Adjustable and Vertical Splice Connectors: Designed to accommodate elevation changes or obstacles in the tray path. Vertical adjustable splices allow modification of tray height while maintaining secure connections . 4. Reducers and Offset Connectors: Used to join trays of different widths or heights, enabling smooth transitions between varying tray sizes without compromising cable support . 5. End Caps and Protective Connectors: End caps protect cables at tray terminations, preventing damage from sharp edges and environmental exposure. Protective connectors also provide strain relief for tray cables, especially in harsh environments . 6. Flexible Expansion Couplers: These connectors compensate for thermal expansion and contraction of metal trays, preventing stress and deformation in long runs .
