

The fiber optic cable to the router can't be unplugged

Article Overview

Yes, a fiber optic cable can be unplugged from a router, but it must be done carefully to avoid damage, contamination, or service interruption.

Key Considerations

Fiber optic cables transmit data using light through delicate glass fibers, making them far more sensitive than traditional copper cables. Improper handling can cause cracks, contamination, or permanent signal degradation. Before unplugging, it's important to:

- Power down the device: Turn off the router or modem to minimize any risk of electrical interference or accidental exposure to infrared light.
- Identify the correct cable: Ensure you are unplugging the intended fiber connection, as unplugging the wrong cable can disrupt other services.
- Check the connector type: Common connectors include SC, LC, ST, and FC. Each may have a push-pull mechanism or latch that must be released properly.

Step-by-Step Unplugging

- Stabilize the device: Hold the router or ONT steady to prevent stress on internal components.
- Grip the connector, not the cable: Always pull on the plastic connector body to avoid stressing the fragile fibers inside.
